

Make use of our software production line

Agile Software Production

Have you ever considered developing one of your custom applications with an external provider? Do you want to keep control of the process so you can have your desired application in the end? Then have your application built on our software production line.

What is Agile Software Production?

The term Agile Software Production covers the implementation of your plan to create a custom-made application up to the provision of a finished, production-ready software solution. We provide all the services needed for the development of your custom-made application. You provide an idea or a requirements document, only participating in the definition of requirements and in acceptances.

In our own internal software production line, we develop a high-quality custom-made application in incremental steps.

When do you use Agile Software Production?

- ... if you want to outsource a work packet in the context of one of your projects.
- ... if you want to develop a new specialized application for your company, but you don't have any free development capacity.
- ... if you want to get from a project idea to executable software very quickly.

Your advantages

Our Agile Software Production realizes your ideas for new custom-made applications, resulting in a complete, ready-to-use software solution. Our agile process in software development makes the result incrementally controllable, and you get executable, production-ready partial solutions on a timely basis. So you get applications tailored specifically to your company and your business processes which have been extensively tested before every delivery.

At a glance

Have your custom-made applications built on our software production line: as Agile Software Production using the methodology of agile software development.

You contribute the idea and the requirements, and we create your application at our site. During development, we provide you with regular acceptance-ready partial results, and you can steer the process at those times.

agile [ædʒ.aɪl] from French agile, from Latin agilis ("agile, nimble"), from agō ("do, act; move").

Agile software development refers to a group of software development methodologies based on iterative development, where requirements and solutions evolve through collaboration between self-organizing cross-functional teams. [...]

incremental [ˈɪŋkrə'mentəl] of, relating to, being, or occurring in especially small increments.

Our procedure: incremental and agile

During implementation, we proceed incrementally and agilely wherever possible. This means that the plan always remains under your control. It can be refined from initial rough notions, step by step. Short development cycles provide you with usable (perhaps partial) results early on in the process.

Our collaboration

Whether you already have a well-defined work packet or simply a more or less concrete idea in mind, our requirements management team uses your specifications as the starting point for a complete, testable bundle of requirements. Once you have approved that, the first development cycle starts. After completion of that cycle shortly, there is an initial partial result we present to you for acceptance.

Now, you have the option of making changes or extending the requirements and the budget. Based on that, the second development cycle starts in the same way, and so on. At the end of the last development cycle, your finished custom-made solution is ready to go: as a custom-built, extensively tested, and high-quality application for your production or as finished partial result for one of your projects. We can also support you upon request with the integration of the solution into your target environment, or with the integration of the work packet result into your overall project.

Interested?

Give us a call. In a consulting discussion, we will identify your plans together, and define a possible framework for our collaboration. On that basis, we will work out a custom-made offer for you – for your custom-made solution!
